

LSS INTERNAL CHIMNEY SEAL INSTALLATION REMINDER

DON'T FORGET THE LUBRICANT. The most often overlooked or skipped step during the installation of the LSS Internal Manhole Chimney Seal is using the Band Lubricant. By not using the lubricant supplied with the seals, the band does not evenly compress around the circumference of the seal when tightening. This uneven compression may lead to the seal loosening up over time and once that happens, the seal is no longer watertight.

- Please read and follow all procedures in the "Installation Instructions", including the use of the band lubricant.
- If the lubricant is missing or has been lost, use any standard sewer or water pipe gasket lube or even dish soap.
- Only a light coating of the lubricant is needed to ensure a proper installation.
